ADAGIO INSTITUTE, INC.

PHD IN MATHEMATICAL PHYSICS
WITH CONCENTRATION IN STOCHASTIC QUANTUM THEORY[1]

The Adagio Ph.D. in Mathematical Physics is, first and foremost, a program designed to produce the world's most rigorously trained theoretical physicists. The core mission is to cultivate a Penrose-level mathematical mastery of physical law, understood not as a set of empirical rules but as a single, unified mathematical structure. The graduate curriculum is uncompromising in its rigor, guiding students from the symplectic geometry of classical mechanics and the differential geometry of field theories to the C*-algebraic formalism of quantum and statistical mechanics. The objective is to produce physicists with a first-principles command of physical law that surpasses that of the world's top academic programs.

We recognize, however, that the traditional academic path is not the sole ambition of every brilliant physicist. For those seeking to maximize the economic value of their expertise, we have created the optimal nonacademic pathway…

Today, money—specifically the U.S. dollar—is a piece of paper effectively created out of thin air by mechanisms that involve the Federal Reserve System, U.S. Department of the Treasury, Bureau of Engraving and Printing, and commercial banking system. The U.S. dollar is no longer backed by gold; it is backed by nothing more than government fiat and debt. There are several different measures of the amount of money in circulation, extending from M0—that counts physical currency and bank reserves—through M3 and MZM—that count money market funds and savings accounts.

One step beyond MZM is the greater world of securities that includes equity and debt instruments representing easily monetizable financial capital in operating companies and investment funds—both public and private. Analogous to how the U.S. dollar is now created, individuals like you can use the same esoteric expertise to create financial capital out of thin air and monetize it for yourself—but you have to execute one additional step….

While the U.S. dollar's value is imposed by government, the value of the financial capital you create is based upon its risk-adjusted performance. Traditional financial education does not provide students with the mathematical tools required to accurately measure and manage risk. Financial mathematics, however, is the language of engineering optimal risk-adjusted investment performance.

Physics embodies the pinnacle of applied mathematics and drives the advancement of computation and engineering. This standard of academic excellence applied to finance and economics enables you to create financial capital of the highest value. While others are trained to work for money, mathematical econophysicists are equipped to literally create it.

[1] This curriculum outlines the essential subject matter to be completed at the graduate level using standardized course titles that are broadly representative of equivalent offerings at most accredited universities.

Advanced Foundations for Mathematical Econophysics:[2] Semester 1

PHIL 1000: Introduction to Philosophy (3)[3]

Major works on such themes as appearance and reality, human nature, nature of knowledge, relation of mind and body, right and good, existence of God and freedom and determinism.

MATH 4031: Advanced Calculus I. (3)

Completeness of the real line, Bolzano-Weierstrass theorem and Heine-Borel theorem; continuous functions including uniform convergence and completeness of C [a,b]; Riemann integration and the Darboux Criterion.

MATH 3355: Probability (3)

Introduction to probability, emphasizing concrete problems and applications; random variables, expectation, conditional probability, law of large numbers, central limit theorem and stochastic processes.

PHYS 2221: Introduction to Mechanics (3)

Basic concepts of mechanics with emphasis on corresponding mathematical techniques.

ECON 2035: Money, Banking and Macroeconomic Activity (3)[4]

Role of commercial banks, other financial institutions and the central bank in affecting the performance of the economy; relationships of money and fiscal policy to prices, production, and employment; internal and external effects of U.S. fiscal and monetary policy.

FINC 4826: Asset Management and Investments (3)[5]

Prereq.: ECON 2035. Characteristics and valuation of common stocks, bonds, options, function and efficiency of U.S. securities markets; theory and practice of portfolio selection.

CMST 2060: Public Speaking (3)[6]

Develop skills needed by the effective communicator and critical consumer of speech. Includes practice in speaking and an introduction to theories and analysis of speeches.

Total Semester Hours: 15[9]

---

[2] Three semesters of intensive leveling coursework designed to equip students from either a B.S. in physics or a B.S. in mathematics with the complementary skills and knowledge required for success in the graduate curriculum.

[3] Introduction to Philosophy introduces a rigorous framework for thinking about quantum mechanics beyond the "shut up and calculate" ethos prevalent in physics, the epistemological nature of risk measurement, and ethics. Satisfies three credit hours of Humanities General Education Course requirements.

[4] Read T*he Theory of Money & Credit* by Ludwig von Mises for an introduction to the Austrian School of Economics.

[5] Read *An Intuitive Total Risk-Adjusted Performance Measure and Characteristics Matrix* (https://www.adagioinstitute.org/strap) for an introduction to the limitations of traditional finance.

[6] Public Speaking equips students with the skills required to compellingly convey the value of their esoteric quantitative expertise to the financial services industry, which is essential for creating autonomous value. Students with a B.S. in physics may take this class in Advanced Foundations for Mathematical Econophysics: Semester 3 to prevent exceeding 15 credit hours per semester.

Advanced Foundations for Mathematical Econophysics: Semester 2

MATH 4032: Advanced Calculus II. (3)

Prereq.: MATH 4031. Differentiation, including uniform convergence, the Mean Value Theorem, and Taylor's Theorem; absolute and uniform convergence of series; completeness of sequence spaces and their duals; real analytic functions; functions of bounded variation; the Stieltjes integral; and the dual of C[a,b].

MATH 4200: Abstract Algebra I. (3)

Elementary properties of sets, relations, mappings, integers; groups, subgroups, normal subgroups, quotient groups, homomorphisms, automorphisms and permutation groups; elementary properties of rings.

MATH 4058: Elementary Stochastic Processes (3)

Prereq.: MATH 3355. Markov chains, Poisson process and Brownian motion.

MATH 4065: Numerical Analysis (3)

An introduction to numerical methods in basic analysis, including root-finding, polynomial interpolation, numerical integration and differentiation, splines and wavelets.

PHYS 2231: Electricity and Magnetism (3)

Prereq.: PHYS 2221. Electricity and magnetism; static and quasistatic electromagnetic fields in vacua and in dielectric and magnetic media.

PHYS 4125: Thermodynamics and Statistical Mechanics (3)

Prereq.: PHYS 2221. Basic physical concepts and methods appropriate for description of systems involving many particles; unified view point of thermodynamics, statistical mechanics and kinetic theory.

PHYS 4141: Introduction to Quantum Mechanics I. (3)

Prereq.: PHYS 2221. Elementary principles of quantum mechanics, including Schrödinger equation, one-dimensional problems, harmonic oscillator, angular momentum, perturbation theory, matrix mechanics and spin.

FINC 4636: Financial Markets and Institutions (3)

Prereq.: ECON 2035. Characteristics and functions of financial markets and institutions; process of financial intermediation and allocation of financial resources; analysis of current developments in financial institutions and in money and capital markets; factors in interest rate determination; management of credit risk, interest rate risk and operating risk.

FINC 4850: Financial Derivatives (3)[7]

Prereq.: FINC 4826. Options, forwards, futures, swaps and other derivative instruments; principles of pricing, valuation models, trading strategies and managing risk in domestic and global financial markets.

Total Semester Hours: 15[9]

[7] Students with a B.S. in physics may take this class in Advanced Foundations for Mathematical Econophysics: Semester 3 to prevent exceeding 15 credit hours per semester.

Advanced Foundations for Mathematical Econophysics: Semester 3

MATH 2030: Discrete Dynamical Systems (3)[8]

The mathematical topics covered are fundamental in mathematical analysis, and are chosen from the area of discrete dynamical systems. These topics include precise definitions of limits, continuity, and stability properties of fixed points and cycles. Quadratic maps and their bifurcations are studied in detail, and metric spaces are introduced as the natural abstraction to explore deeper properties of symbolic dynamics, chaos, and fractals.

MATH 4025: Optimization Theory and Applications (3)

Basic methods and techniques for solving optimization problems; n-dimensional geometry and convex sets; classical and search optimization of functions of one and several variables; linear, nonlinear, and integer programming.

MATH 4201: Abstract Algebra II. (3)

Prereq.: MATH 4200. Ideals in rings, factorization in polynomial rings, unique factorization and Euclidean domains, field extensions, splitting fields, finite fields, Galois theory.

or MATH 4153: Finite Dimensional Vector Spaces (3)

Vector spaces, linear transformations, determinants, eigenvalues and eigenvectors, and topics such as inner product space and canonical forms.

PHYS 4123: Intermediate Mechanics (3)

Prereq.: PHYS 2221. Lagrangian mechanics; central force motion; rigid body dynamics; small oscillations.

PHYS 4132: Electromagnetism and Electromagnetic Waves (3)

Prereq.: PHYS 2231. Emphasis on electromagnetic waves and radiation.

PHYS 4142: Introduction to Quantum Mechanics II. (3)

Prereq.: PHYS 4141 Multi-particle systems, identical particles, addition of angular momentum, time-dependent perturbation theory, variational methods, WKB approximation and scattering theory.

PHYS 4112: Intermediate Mathematical Physics (3)

Prereq.: PHYS 2221. Mathematical methods of physics, with application to selected problems.

PHYS 2411: Computational Science (3)

Prereq.: PHYS 2221. 2 hrs. lecture; 2 hrs. lab. Introduction to symbolic manipulation and numerical techniques used to analyze or simulate a broad range of physical systems.

Total Semester Hours: 15[9]

---

[8] Two advanced texts are recommended to supplement formal coursework, establishing the foundation for indivisible stochastic dynamical systems and mathematical econophysics research:

1) *Nonlinear Dynamics and Chaos* by Steven H. Strogatz for students applying dynamical systems theory to complex systems, including topics such as bifurcations, limit cycles, and Lyapunov exponents.

2) *Fractals and Scaling in Finance* by Benoît B. Mandelbrot for students pursuing empirical modeling of financial time series involving scaling laws, long memory, and non-Gaussian structures.

[9] Students with a B.S. in physics should have completed PHYS 2221, 2231, 2411, 4123, 4132, 4125, 4141, 4142 and 4112. Students with a B.S. in math should have completed MATH 2030, 3355, 4025, 4031, 4032, 4200, 4201, 4058 and 4065.

Core Graduate Curriculum Semester 1 (Fall)

PHIL 4951: Philosophy of Science (3)[10]

Prereq.: PHIL 1000. Philosophical issues related to concept formation and theory construction in the natural, behavioral, and social sciences.

MATH 7311: Real Analysis (3)

Prereq.: MATH 4032. Abstract measure and integration theory with application to Lebesgue measure on the real line and Euclidean space.

MATH 7210: Algebra I. (3)

Prereq.: MATH 4200. Groups: Group actions and Sylow Theorems, finitely generated abelian groups; rings and modules: PIDs, UFDs, finitely generated modules over a PID, applications to Jordan canonical form, exact sequences.

Total Semester Hours: 9

Core Graduate Curriculum Semester 2 (Spring)

MATH 7350: Complex Analysis (3)

Prereq.: MATH 7311. Theory of holomorphic functions of one complex variable; path integrals, power series, singularities, mapping properties, normal families, other topics.

MATH 7360: Probability Theory (3)

Prereq.: MATH 3355 and MATH 7311. Probability spaces, random variables and expectations, independence, convergence concepts, laws of large numbers, convergence of series, law of iterated logarithm, characteristic functions, central limit theorem, limiting distributions, martingales.

PHYS 7221: Classical Mechanics (3)

Prereq.: PHYS 4123, MATH 7210, and MATH 7311. Study of particle mechanics and rigid body mechanics using the methods of Lagrange's equations, Hamilton's equations, canonical transformations and Hamilton-Jacobi theory.

Total Semester Hours: 9

[10] Philosophy of Science introduces a rigorous framework for thinking about quantum mechanics beyond the "shut up and calculate" ethos prevalent in physics and the epistemological nature of risk measurement.

Core Graduate Curriculum Semester 3 (Fall)

MATH 7330: Functional Analysis (3)

Prereq.: MATH 7311. Banach spaces and their generalizations; Baire category, Banach-Steinhaus, open mapping, closed graph, and Hahn-Banach theorems; duality in Banach spaces, weak topologies; spectral theory. C*-algebras and von Neumann algebras; positive functionals and states; the Gelfand-Naimark-Segal construction and representations; commutative Banach algebras, distributions, and Fourier transforms; introduction to modular theory and KMS states in preparation for the algebraic formulation of quantum and statistical mechanics.

MATH 7366: Stochastic Analysis (3)

Prereq.: MATH 4058 and MATH 7360. Wiener process and its path properties; the Itô stochastic integral and Itô's formula; stochastic differential equations, existence and uniqueness, and the strong Markov property of diffusions; the infinitesimal generator and its adjoint, with the backward Kolmogorov equation on observables and the Fokker-Planck equation on densities; the Chapman-Kolmogorov relation for diffusion semigroups; the Onsager-Machlup action and its most-probable-path characterization; the path-integral representation of diffusions.

MATH 7510: Topology I. (3)

Basic notions of general topology, with emphasis on Euclidean and metric spaces, continuous and differentiable functions, inverse function theorem and its consequences.

Total Semester Hours: 9

Core Graduate Curriculum Semester 4 (Spring)

MATH 7386: Theory of Partial Differential Equations (3)

Prereq.: MATH 7330. Sobolev spaces. Theory of second order scalar elliptic equations: existence, uniqueness and regularity. Additional topics such as: Direct methods of the calculus of variations, parabolic equations, eigenvalue problems.

PHYS 7225: Statistical Mechanics (3)

Prereq.: PHYS 4125, MATH 7330, and MATH 7360. Principles of classical and quantum statistics, with application to special problems; the algebraic characterization of equilibrium via the Kubo-Martin-Schwinger (KMS) condition, thermal states as KMS states, and the thermodynamic limit for systems where no density-matrix description exists.

PHYS 7231: Electrodynamics I. (3)

Prereq.: PHYS 4132 and MATH 7350. Electrostatics with boundary value problems via Green's functions and multipole expansion; dielectric materials and polarization; magnetostatics via Biot-Savart and Ampère's laws; magnetic materials and magnetization; Faraday's law and the full Maxwell equations; conservation of energy and momentum in electromagnetic fields.

Total Semester Hours: 9

Core Graduate Curriculum Semester 5 (Fall)

MATH 7550: Differential Geometry (3)

Prereq.: MATH 7210 and MATH 7510. Manifolds, vector fields, vector bundles, transversality, Riemannian geometry, other topics.

PHYS 7232: Electrodynamics II. (3)

Prereq.: PHYS 7231. Propagation of electromagnetic waves in vacuum, conductors, and dispersive media; wave guides, resonant cavities, and antenna theory; special relativity and the covariant formulation of electrodynamics via the field tensor and four-potential; Liénard-Wiechert potentials and radiation from accelerated charges including synchrotron radiation and bremsstrahlung.

PHYS 7241: Quantum Mechanics I. (3)

Prereq.: PHYS 4142 and MATH 7330. Mathematical foundations of nonrelativistic quantum mechanics including Hilbert space formalism and observables as Hermitian operators, introduced alongside the algebraic viewpoint of observables as self-adjoint elements of an operator algebra and states as expectation functionals; time-dependent and time-independent Schrödinger equations applied to one-dimensional and central-potential problems; intrinsic and orbital angular momentum and their addition; time-independent and time-dependent perturbation theory; atomic structure and the hydrogen atom.

Total Semester Hours: 9

Core Graduate Curriculum Semester 6 (Spring)

MATH 7325: Advanced Numerical Analysis and Applications (3)

Prereq.: MATH 4065. Finite difference methods; finite element methods; iterative methods; methods of parallel computing; applications to the sciences and engineering.

PHYS 7211: Mathematical Methods in Theoretical Physics I. (3)

Prereq.: PHYS 4112. Advanced topics in mathematical methods of theoretical physics; mathematical foundations of quantum mechanics.

PHYS 7242: Quantum Mechanics II. (3)

Prereq.: PHYS 7241. Variational and WKB approximation methods; identical particles and the symmetrization postulate; scattering theory including the Born approximation, partial wave analysis, and the optical theorem; second quantization and the many-body formalism; relativistic quantum mechanics via the Klein-Gordon and Dirac equations; introduction to the path-integral formulation as preparation for quantum field theory.

Total Semester Hours: 9

Core Graduate Curriculum Semester 7 (Fall)

PHYS 7212: Mathematical Methods in Theoretical Physics II. (3)

Prereq.: PHYS 7211. Advanced topics in mathematical methods of theoretical physics; mathematical foundations of quantum mechanics.

PHYS 7336: General Relativity (3)

Prereq.: PHYS 7232, MATH 7350, and MATH 7550. General tensor analysis; postulates of general relativity, field equations, equations of motion, interior and exterior Schwarzschild solutions; cosmology.

PHYS 7411: Computational Physics I. (3)

Prereq.: PHYS 2411 and PHYS 7211. Basic numerical techniques for solution of mathematical equations, including coupled linear algebraic and differential equations and numerical simulation techniques; emphasis on application to physical problems.

Total Semester Hours: 9

Core Graduate Curriculum Semester 8 (Spring)

MATH 7369: Dynamical Systems and Ergodic Theory. (3)

Prereq.: MATH 7366, MATH 7386, and MATH 7510. Topological dynamics including invariance, recurrence, and minimality; measure-preserving transformations and the ergodic theorems of Birkhoff and von Neumann; mixing properties and weak mixing; Kolmogorov-Sinai entropy and topological entropy; Lyapunov exponents and the multiplicative ergodic theorem; the Koopman operator and Perron-Frobenius (transfer) operator as dual operator-theoretic representations of dynamics on observables and densities; C*-dynamical systems and the crossed-product construction for dynamics carrying a group action; spectral theory of dynamical systems with connections to Markov processes and Chapman-Kolmogorov factorization.

PHYS 7745: Quantum Field Theory (3)

Prereq.: PHYS 7232 and PHYS 7242. Canonical quantization of fields, path integrals, Feynman diagrams, renormalization, and gauge theories; introduction to algebraic quantum field theory via the Haag-Kastler axioms and local nets of observable algebras, connecting the canonical formalism to its rigorous algebraic axiomatization.

PHYS 7412: Computational Physics II. (3)

Prereq.: PHYS 7411. Advanced numerical techniques for many-body systems, including Monte Carlo methods, the Metropolis algorithm, simulated annealing, variational optimization, and replica methods for disordered systems; emphasis on application to statistical mechanics.

Total Semester Hours: 9

Total Core Graduate Curriculum Hours: 72

Coursework Consideration & Non-Coursework Ph.D. Requirements

Not including Advanced Foundations for Mathematical Physics coursework. Traditional Ph.D. programs include 30 to 36 credit hours plus uncredited general exam preparation. The Adagio Institute model replaces general and qualifying exams with a formally credited 72-hour curriculum that ensures mastery of foundational and advanced topics. This reflects international best practices and the Institute's commitment to functional expertise over bureaucratic tradition. The substantive standards applied are reproducibility for empirical work and logical consistency with a testable hypothesis for theoretical work. Dissertation research begins in Semesters 7 and 8, concurrent with advanced methods and computation coursework. Upon completing the 72-hour curriculum (excluding approved leveling courses), students must also meet the following requirements to be awarded the Ph.D. in Mathematical Physics:

1. Dissertation Research and Defense

Students must conduct original, high-level research that contributes meaningfully to the field of mathematical modeling in complex systems. This includes the integration of empirical stochastic methods, quantum theoretical constructs, and statistical mechanics in line with the methodological principles articulated in the Adagio Institute's Standard Model of Complex Economic Systems.

Research topics may span areas such as:

- Advanced Quantum Mechanics and Field Theory
- Stochastic Quantum Field Theory and Dynamics
- Functional Analysis and Operator Algebras in Physics
- Computational Analysis of Quantum and Relativistic Systems
- Quantum Information Theory and Computation
- Modeling of Complex Economic and Physical Systems

The dissertation must be defended in a public oral examination before a doctoral committee approved by the Adagio Institute Board of Academic Directors.

2. Deposit Requirement

The dissertation must be deposited publicly as at least two distinct works on a recognized preprint or working paper repository such as arXiv, SSRN, or Zenodo, each constituting a substantial portion of the student's contribution. At least one deposit must fall within the fields of applied mathematics, physics, or quantitative finance.

3. Colloquium Presentation

Before dissertation defense, each student is required to deliver a formal research colloquium to the Adagio Institute academic community summarizing their findings, methodology, and theoretical contribution.

4. Professional Conduct and Contribution

Students are expected to demonstrate professional integrity, collegiality, and a commitment to the advancement of knowledge within the Adagio Institute and its broader academic partnerships.

Ph.D. in Mathematical Physics by Published Works

The Ph.D. in Mathematical Physics may alternatively be awarded for the submission of a portfolio of published works meeting the same substantive standard as the traditional dissertation route. The route is modeled on the published-works regulations of leading research universities, adapted to Adagio Institute's dissemination standards: works need not have appeared in peer-reviewed journals, provided they are publicly deposited on a recognized preprint or working paper repository. This is consistent with the deposit requirement of the traditional route, which treats public deposit as the standard of dissemination, and with the Institute's substantive standards, which attach to the content of the works rather than the venue of their publication.

1. Eligibility

Candidates must be either members of the academic staff of the Adagio Institute or research associates of Adagio Capital Management holding a bachelor's degree or equivalent. A prior Adagio Institute degree is not required.

2. The Portfolio

Candidates submit between three and eight works that form the intellectual basis of the examination. Each work must be either published in a peer-reviewed venue or publicly deposited on a recognized repository such as arXiv, SSRN, PhilSci-Archive, or Zenodo. The subject matter of the portfolio must be congruent with the Ph.D. in Mathematical Physics curriculum so that the portfolio may be rigorously examined by Adagio Institute faculty. The submission must include contextual information for each work, including the candidate's individual contribution, the profile of the publication venue or repository, citations received, and the work's significance to the field.

3. Covering Document

During the period of enrollment, candidates must submit a covering document of 5,000 to 10,000 words setting out the relationship between the works presented and their significance as an original contribution to knowledge within the relevant field, together with, as an appendix, a full bibliography of the candidate's published and deposited works.

4. Consideration and Admission

The Executive Director will appoint a member of the Institute faculty to advise on the presentation of the portfolio and to prepare a statement assessing the candidate's suitability for admission, the quality of the works presented, and the candidate's expertise and profile within the field. Admission requires the approval of the Adagio Institute Board of Academic Directors and is conditional upon the candidate's continued employment with Adagio Institute or Adagio Capital Management for the period of enrollment. Admission does not guarantee the award of the degree; candidates must successfully complete the examination.

5. Examination

The purpose of the doctoral examination is to determine whether the submitted portfolio demonstrates doctoral-level originality, independent research ability, and a coherent contribution to knowledge. The examination shall evaluate the submitted research program as a whole. The examination shall assess the

submitted research on its scholarly merits independent of its publication status. Publication-level revisions identified during examination shall not, by themselves, preclude award of the degree unless they materially undermine the originality, coherence, validity, or doctoral character of the submitted research program.

The examination shall consist of:

1. Technical evaluation of the submitted portfolio
2. Written response by the candidate, where requested by the examiner(s)
3. Recommendation by one or more appointed Doctoral Examiners
4. Final determination by the Board of Academic Directors

The Board may render one of the following decisions:

- Pass
- Pass subject to revisions
- Revise and resubmit for further examination
- Does not satisfy the requirements for award of the degree

5.1 Doctoral Examiner(s)

The Board of Academic Directors shall appoint one or more Doctoral Examiners possessing appropriate expertise in the discipline relevant to the submitted work.

The Doctoral Examiner(s) may commission such independent technical evaluations as they deem appropriate in conducting the examination. The identity of any person engaged to provide an independent technical evaluation need not be disclosed in the archival examination record. Where anonymity is maintained, the technical evaluation shall be incorporated into the Doctoral Examination Report through the findings adopted by the Doctoral Examiner(s), who remain responsible for the recommendations and conclusions submitted to the Board of Academic Directors.

The Doctoral Examiner(s) may require an oral examination where, in their judgment, it is necessary to clarify issues arising during the technical examination or to determine whether the submitted portfolio satisfies the Institute's published doctoral standard. An oral examination shall not be required where the Doctoral Examiner(s) determine that the written record provides a sufficient basis for recommendation.

The Doctoral Examiner(s) shall recommend an examination outcome to the Board of Academic Directors.

5.2 Covering Document

The covering document shall ordinarily consist of a synthesis of approximately 5,000–10,000 words describing the relationship among the submitted works and their collective scholarly contribution.

Upon recommendation of the Doctoral Examiner(s), the Board of Academic Directors may waive this requirement when the submitted works themselves provide sufficient integration and context to permit examination without an additional synthesis document.

Waiver of the covering document shall not reduce the academic standard required for award of the degree.

5.3 Doctoral Examination Report

Upon completion of the examination, the Doctoral Examiner(s) shall prepare a Doctoral Examination Report documenting the examination and recommending an outcome to the Board of Academic Directors.

The report shall include, where applicable, technical evaluations, candidate responses, recommended revisions, and such additional material as the Doctoral Examiner(s) consider relevant to the examination.

The Doctoral Examination Report shall be archived as part of the permanent academic record. The Institute may make the report publicly available.
