Ben,

I overlooked your addendum on revision 2.1 when I wrote my response.
Three corrections follow; none changes the substance of my assessment.

The version my verification refers to. I established which text I had verified from the markers your addendum lists: the significance statement is absent, the conditioning bound is written K, Example 4.10 gives the block masses per time,
Example 8.5 states the ε² rate, Remark 3.6 defines e_b, and the Koopman citation carries its strongly measurable, Bochner-integrable scope.
All six are present, so the whole verification section of my previous message refers to revision 2.1, and your section and result numbers resolve
correctly against it, the one declared exception being F_κ for the paper's F_K.

My second request is withdrawn as I put it. I asked for a cross-reference you had deliberately removed.
Citing only the four papers that precede this one is the better arrangement and cleaner than what I proposed,
since the later paper takes this one as its foundation and a reciprocal citation would make the dependence circular.
What the criterion does not settle is that Proposition 5.3's non-constructive exponent, Open Problem (ii) and Open Problem (v) all stand as
open or unimproved although the later paper settles them, so a reader of the portfolio finds no link.
One sentence in Open Problem (v) pointing to a later paper of the series, or the link placed in the portfolio presentation instead of the manuscript,
would be fine.

One thing noted, with no request attached. In restating the sentences that carried the removed citation you also withdrew the clause that
the metric charge does not decompose algebraically, which no result of the paper proves and which neither report had challenged.

The rest of my previous message stands, including the limits and the closing.

Best,
Ezequiel
