Hi Ezequiel,

Thank you. I take the addition, and it is sharper than what Section 7 said. The two constraints the paper supplies act on access in time and on the observation protocol, and neither bounds history depth or state-space dimension, so a history state on a grid coarser than the Planck bound passes both and has zero defect. The class is unpinned exactly where augmentation acts. That sentence now ends Section 7, and the updated manuscript is at https://dx.doi.org/10.2139/ssrn.6922380; nothing else changed. It goes into the portfolio commentary as the open problem the set leaves. The constraint that is missing is a bound on history depth or state-space dimension, which is the quantity the memory-rank paper measures relative to a fixed description; whether that quantity can be made invariant within a class bounded in dimension is the question I take from this exchange, and I am not claiming an answer.

Send the corrected report when it is ready and I will file it with the deposit.

Ben
