Ben,

The corrected report is attached: TR-P01-DOCv2-EX01-Rv2. It adds no correction to Revision 1 (the four amendments there stand).
Its object remains the 7 September deposit.

I audited your declaration rather than taking it. Everything is ok.

Section 7 now carries the whole statement of the gap; no description-independent formulation, augmentation renders any process Markov,
such a formulation therefore needs a physically fixed class of admissible descriptions, this paper fixes it only in part, and neither constraint acts
where augmentation acts.

On that last point, one precision, since the integrated report should carry it with its exact scope. The direction is right: bounding the dimension
does exclude the path-space description, which is what blocks the impossibility argument. But memory rank is defined relative to a *fixed* observed state
space and transition family (under a change of description the family changes and the rank with it, so bounding the class does not by itself make the
rank invariant).

The open problem is the portfolio's and not a defect of this paper. A paper whose object is a presupposition may leave the invariant unconstructed
provided it says so, and Section 7 now says so as sharply as it can. Paper 1 is closed with no outstanding amendments.

Best,
Ezequiel
