To: Ezequiel Boero <ezequiel.boero@adagioinstitute.org>, "ISMAIL-SUTTON, SARA R." <sara.r.ismail-sutton@durham.ac.uk>

Sara,

Thank you for reading the responses. The exact examples of Section 8 have been re-derived independently by Ezequiel from the printed definitions, with the record in his previous comments.

Ezequiel,

Thank you for the verification of the new material and for the corrections in your second message. Your record now refers to revision 2.1 throughout, with F_κ read as F_K, and it confirms every value in Section 8 and the chain of Theorem 5.7(d) and Corollary 5.9. The July-dated deposit and the mistyped DOI account for the two texts.

The three limits you state are: the exact examples give witnesses and floors and certify no minimal hidden dimension for an arbitrary non-flat process-induced family, so your Question 3 stands open; the converse of Theorem 5.11(a) is open when every optimal law has a vanishing marginal (Remark 5.12); and the compactified class is posed and not constructed, so the closed-model reading is the operative one throughout. The class exchange rate survives in the paper only as the closed form of Example 8.4.

Attribution: the paper keeps the program's form, one sentence in the Acknowledgments and no notes at the results.

Cross-references: the paper cites the four papers that precede it in the series and none that follows, by the rule the series now applies, so Proposition 5.3's exponent, Open Problem (ii) and Open Problem (v) stand in the manuscript as it states them, and the manuscript carries no forward pointer.

The clause that the metric charge does not decompose algebraically was withdrawn because no result of the paper proves it; Open Problem (v) is unchanged.

Ben
