Hi Ben,

Thank you for the detailed and careful response.

The changes you describe address the substance of my comments, particularly the reframing of the fixed-weight mixture as an abstract convex perturbation, the distinction between the behaviour of the upper bound and that of the exact deficit, the possibility of an interior divisible coupling, the sharper quadratic terminal-threshold estimate, and the qualification of operational detectability.

Regarding the two recommendations you did not adopt, I think both decisions are reasonable.

The pointwise two-state example is sufficient provided that its status, and its distinction from the scale-level results, are made explicit as you describe. Retaining Section 5 in compressed form also seems justified where its purpose is to provide the quantitative connection with the integrated deficit used in the Koopman paper.

I therefore have no further points arising from your response at this stage.

Best wishes,

Dr Sara Ismail-Sutton
